1 Purpose

2 Experimental Details

The RNA expression data was downloaded from GSE72759 as a matrix file, and compared with genotypes from the Svenson-183 dataset.

3 Raw Data

```
library(readr) #loads the readr package
expression.filename <- "GSE72759_D0192_RNAseq_UpperQuartileNormalized_n21454genes_forGE0Submission.txt"
expression.data <- read_tsv(expression.filename, show_col_types = F) %>%
    dplyr::rename(ENSEMBL.ID=1)
```

```
genotype.filename <- 'Svenson_183_Svenson_DO-MegaMUGA-calls.csv'</pre>
genotype.data <- read_csv(genotype.filename,</pre>
                            col_types = cols(
  .default = col_character(),
  chr = col_factor(levels=NULL),
  pos = col_double()
))
phenotype.filename <- 'Svenson_HFD_D0_phenotype_V12.csv'</pre>
phenotype.data <- read_csv(phenotype.filename)</pre>
phenotype.data[phenotype.data=='-999999'] <- NA</pre>
mean.expression <-</pre>
  expression.data %>%
  dplyr::select(contains(phenotype.data$mouse.id))%>%
expression.data <-
   expression.data %>%
   filter(mean.expression>10)
```

4 Analysis

Only evaluated gene expression for genes with >10 TPM

4.1 Cholesterol Levels

Regressed cholesterol levels by diet and sex

Table 1: Summary statistics for cholesterol levels at 8 weeks

| sex | diet | mean | se | sd | n |
|--------------|-----------------------|------|------|---------------------|-----|
| F | chow | NA | 1.16 | NA | 225 |
| F | \mathbf{hf} | 108 | 1.78 | 25 | 198 |
| Μ | chow | NA | 1.47 | NA | 224 |
| \mathbf{M} | hf | NA | 2.09 | NA | 193 |

```
library(broom)
lm(chol1~sex*diet, data=phenotype.data) %>%
  tidy %>%
  kable(caption="Global interactions between sex and diet")
```

Table 2: Global interactions between sex and diet

| term | estimate | $\operatorname{std.error}$ | statistic | p.value |
|-------------|----------|----------------------------|-----------|---------|
| (Intercept) | 79.99 | 1.68 | 47.751 | 0.000 |
| sexM | 16.43 | 2.37 | 6.925 | 0.000 |
| diethf | 28.48 | 2.38 | 11.989 | 0.000 |
| sexM:diethf | 3.33 | 3.37 | 0.986 | 0.324 |

Table 3: Summary statistics for cholesterol levels at 8 weeks

| sex | diet | mean | se | sd | n |
|--------------|---------------------|------|------|---------------------|-----|
| F | chow | NA | 1.16 | NA | 225 |
| \mathbf{F} | hf | 108 | 1.78 | 25 | 198 |
| \mathbf{M} | chow | NA | 1.47 | NA | 224 |
| M | hf | NA | 2.09 | NA | 193 |

```
library(broom)
lm(chol1~sex*diet, data=phenotype.data) %>%
  tidy %>%
  kable(caption="Global interactions between sex and diet")
```

Table 4: Global interactions between sex and diet

| term | estimate | std.error | statistic | p.value |
|-------------|----------|-----------|-----------|---------|
| (Intercept) | 79.99 | 1.68 | 47.751 | 0.000 |
| sexM | 16.43 | 2.37 | 6.925 | 0.000 |
| diethf | 28.48 | 2.38 | 11.989 | 0.000 |

| term | estimate | std.error | statistic | p.value |
|-------------|----------|-----------|-----------|---------|
| sexM:diethf | 3.33 | 3.37 | 0.986 | 0.324 |

```
chol.lm <- lm(chol1~sex+diet, data=phenotype.data)
chol.lm.hf <- lm(chol1~sex, data=filter(phenotype.data, diet=='hf'))

cholesterol.data.hfd <-
   phenotype.data %>%
     filter(!is.na(chol1)) %>%
   filter(diet=='hf') %>%
   mutate(adj.chol.hf=residuals(chol.lm.hf)+coefficients(chol.lm.hf)['(Intercept)'])
```

plot(vd.all, main="Transcripts Associating with Cholesterol")

Transcripts Associating with Cholesterol

Our analysis identified **216** nominally significant associations between expression of genes and adjusted cholesterol levels on a normal chow diet. Among those, 44 were positively correlated and 44 were negatively correlated with cholesterol levels.

6.1 TWAS Modification by Sex

By modeling the interactions between sex and expression on cholesterol levels, we identified **205** genes where the cholesterol/expression relationship was modified by sex in a nominally significant manner. This included 19 genes where the relationship was stronger in males, and 186 where it was stronger in females.

7 Comparason with mouse GWAS
